Introduction of Microsoft Visual Studio Enterprise 2019

Microsoft Visual Studio is software developed for computer programmers developed by the Microsoft software company. It provides a variety of tools for large or small teams to build applications for a variety of platforms. In each new release, the stack of these tools is trying to get bigger and is the first choice for most programming teams working on Windows. It also supports side extensions to enlarge this stack or add other special features to the software itself. Will help meet most of the needs of programmers. Visual Studio can now write applications for desktop computers, mobile phones, cloud systems, home consoles, and web servers in popular languages such as Python, C Plus Plus, C # or F #.

The new version of Visual Studio, compared to its previous versions, includes a new installer that reduces the minimum volume required dramatically and will not be as painful as installing and removing it from previous versions. Also, try to make sure all the packages installed are one piece and that everything is compatible with the operating system as far as possible. In addition, the program's own execution speed has also been improved and your projects need to load faster.

In addition, the 2019 version is trying to support the latest version of SDKs and various languages. Eighth version of C #, much more complete support of the 14 and 17 C ++ standards, support for the 1809 version of the Windows 10 SDK are examples of this. New features such as instant checking and instant project dependencies are also available in this release.

All in all, Visual Studio is one of the most user-friendly programming environments on the market where any team of developers of any size and scale can use its technologies to better implement their projects.
